Grain Dust Explosions Up In 1993*

Reversing a twelve year downward trend, there were 13 grain dust explosions reported for the U.S. in 1993 according to Robert W. Schoeff, Consultant and Professor Emeritus, Kansas State University, and Dalek Pagan

[Metadata, citation and similar papers at core.ac.uk](https://core.ac.uk/)

Provided by K-State Research Exchange

a ten-year average of 15 explosions.

There were two fatalities and 20 persons injured.

Nine of the thirteen incidents occurred in grain elevators; the others in a food plant, candy factory, flour mill, and wet corn plant.

The bucket elevator (leg) continues as the leading location for the primary explosion (6).

The probable cause of ignition for nine cases was bearing failure (3), head pulley out of alignment and rubbing against the metal housing (2), welding and cutting, fire from burning ingredients, electrical short, and sparks from foreign material.

Fuel sources were identified as corn (9), cornstarch (2), wheat, and soybeans.

Most of the grain dust explosions occurred in the midwest with three in Nebraska, two in Ohio, and one in Indiana, Iowa, Minnesota, and Wisconsin. There were two in Louisiana and one in Mississippi and New Jersey.

Property damage was estimated to be \$3,510,000.00.

Appreciation is expressed to the many persons who provided the information that allowed us to compile data on grain dust explosions as a service to the grain storage and processing and allied industries, trade associations, and government agencies.
